## **Advanced Structural Inorganic Chemistry (International Union of Crystallography Texts on Crystallography)** Wai-Kee Li, Gong-Du Zhou, Thomas Mak

A revised and updated English version of a postgraduate textbook that has grown out of several years of classroom development. The term "inorganic" is used in a broad sense as the book covers the structural chemistry of representative elements (including carbon) in the Periodic Table, organometallics, coordination polymers, host-guest systems and supramolecular assemblies.

Part I of the book reviews the basic bonding theories, including a chapter on computational chemistry. Part II introduces point groups and space groups and their chemical applications. Part III comprises a succinct account of the structural chemistry of the elements in the periodic table. It presents structure and bonding, generalizations of structural trends, crystallographic data, as well as highlights from the recent literature.
